## Solution 1.11

$\mathrm{q}=\mathrm{it}=90 \times 10^{-3} \times 12 \times 60 \times 60=3.888 \mathbf{k C}$

## Solution 1.12

For $0<\mathrm{t}<6 \mathrm{~s}$, assuming $\mathrm{q}(0)=0$,
$q(t)=\int_{0}^{t} i d t+q(0)=\int_{0}^{t} 3 t d t+0=1.5 t^{2}$
At $t=6, q(6)=1.5(6)^{2}=54$
For $6<t<10 s$,
$q(t)=\int_{6}^{t} i d t+q(6)=\int_{6}^{t} 18 d t+54=18 t-54$
At $\mathrm{t}=10, \mathrm{q}(10)=180-54=126$
For $10<t<15 \mathrm{~s}$,
$q(t)=\int_{10}^{t} i d t+q(10)=\int_{10}^{t}(-12) d t+126=-12 t+246$

At $\mathrm{t}=15, \mathrm{q}(15)=-12 \mathrm{x} 15+246=66$
For $15<t<20 s$,
$q(t)=\int_{15}^{t} 0 d t+q(15)=66$
Thus,
$q(t)=\left\{\begin{array}{c}1.5 t^{2} \mathbf{C}, \mathbf{0}<\mathbf{t}<\mathbf{6 s} \\ 18 t-54 \mathbf{C}, \mathbf{6}<\mathbf{t}<\mathbf{1 0 s} \\ -12 t+246 \mathbf{C}, \mathbf{1 0}<\mathbf{t}<\mathbf{1 5 s} \\ 66 \mathbf{C}, \mathbf{1 5}<\mathbf{t}<\mathbf{2 0 s}\end{array}\right.$

Find I and the power absorbed by each element in the network of Fig. 1.30.

Figure 1.30
For Prob. 1.19.
$\mathrm{I}=-10+4=-6 \mathbf{a m p s}$
Calculating the power absorbed by each element means we need to find vi (being careful to use the passive sign convention) for each element.
$\mathrm{P}_{10 \mathrm{amp} \text { source }}=-10 \times 15=\mathbf{- 1 5 0} \mathbf{W}$
Pelement with 15 volts across it $=4 \times 15=\mathbf{6 0} \mathbf{~ W}$
Pelement with 9 volts across it $=-(-6 \times 9)=54 \mathrm{~W}$
p 6 volt source $=-(-6 \mathrm{x} 6)=\mathbf{3 6} \mathbf{~ W}$
One check we can use is that the sum of the power absorbed must equal zero which is what it does.

## Solution 1.20

$\mathrm{p}_{\text {the }}$ 5lo dependent source $=5 \mathrm{x} 2 \mathrm{x}(-3)=\mathbf{- 3 0} \mathbf{~ W}$
